Study workflow (v0.8). Raw outputs are not modified by the analysis.
1 Calibration
seeds 8000-8019 only
thresholds from mean mutation counts (no error metric)
28-point grids, runs capped at 12
2 Amendment 1
before any held-out run:
finer grids for 7 excluded arm-cells + lower bound for B8 in S2 at M = 6; same seeds
3 Freeze
configs + count PMFs + SHA-256 manifest (78 entries)
commit e16a208
4 Held-out evaluation
seeds 9000-9059, run once
4,500 runs (12 arms x 6 cells x 60 seeds + Static)
Development seeds 8100-8119
E1 predictor validation, smoke tests, code review;
never reported as results and never used to set a threshold
5 Pre-specified paired analysis
Wilcoxon signed-rank, Holm per family (18 / 48 / 12 tests)
95% bootstrap CI, rank-biserial r, margin 0.02;
equivalence only if Holm p >= 0.05 and CI inside +-0.02
